Thank you for choosing a transducer from Hugo Tillquist AB!

ConfigLQT is the software used for the configuration of our transducers via their USB port in a simple and convenient way. It is free and can be downloaded from our website: www.tillquist.com .

1 General information

1.1 Introduction

This manual provides the information necessary for the proper use of ConfigLQT and some examples of configuration for our transducers. The information in the manual is intended for use by technically qualified personnel.

The ConfigLQT software is free and can be downloaded from our website: www.tillquist.com. We always recommend the use of the latest version of ConfigLQT.

1.2 Marking – Symbols

Our transducers are marked with the following symbols.

Double insulated device.

Warning for life-threatening or hazardous for properties situations.

1.3 Contact info

You can always contact Hugo Tillquist AB for questions about ConfigLQT. Contact info of all our colleagues is available on our website: www.tillquist.com.

1.4 Copyrights

The copyrights for this manual are reserved.

The surrender of this manual to third parties, reproduction in every type or form including extraction of contents is not permitted without written permission from Hugo Tillquist AB. Any violations oblige for compensation. Hugo Tillquist AB reserves the right for additional titles.

The copyrights are reserved for Hugo Tillquist AB.

2 Instructions

2.1 Installation of ConfigLQT

The installation kit consists of the configuration software and a driver for the USB connection. ".NET Framework" version 4.0 is a software from Microsoft, usually installed by default, that is necessary for the proper operation of ConfigLQT. If not already installed, it can be downloaded by the following link: <http://www.microsoft.com/net/>.

Download ConfigLQT from www.tillquist.com, unzip the files and install it by running the setup.

3 Configuration

3.1 Connection to computer

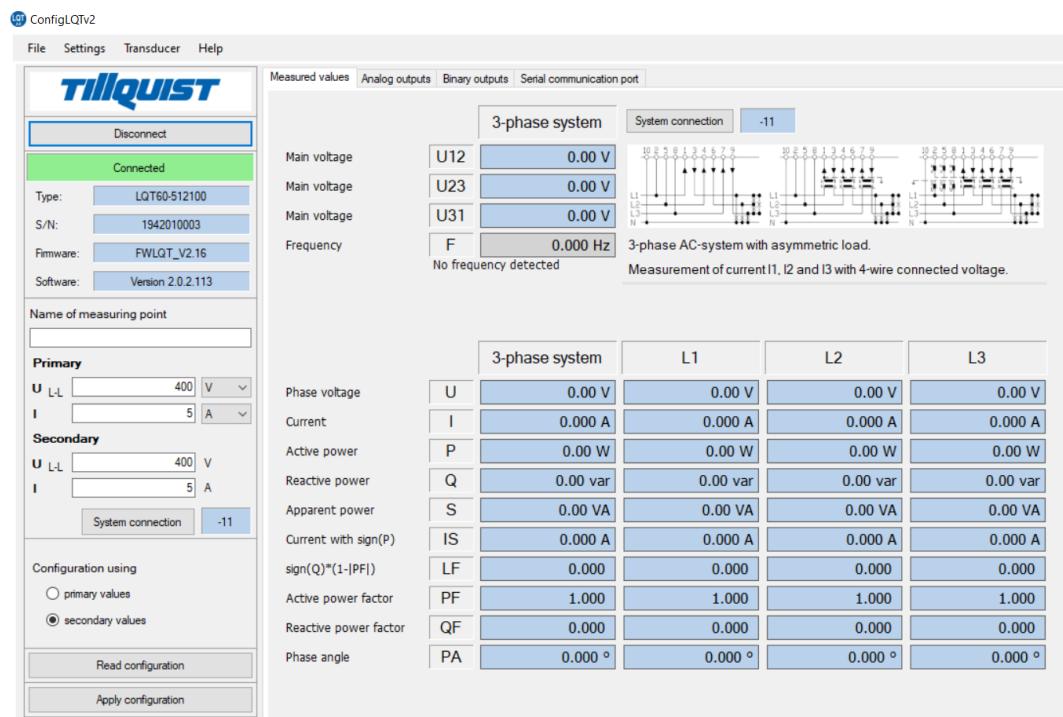

Connect a USB-cable between the USB-port on the device and the computer. No safety action is required while connecting the USB cable to the device.

Start ConfigLQT and click Connect.

The connection status will change to **Connected** with a green background and information about the transducer will be displayed once the connection is established.

Depending on the type of the connected transducer, various basic parameters as well as all the possible connections for 1-phase or 3-phase networks are displayed. The measured values are displayed on the screen when the transducer is connected to a measuring object. The measured values can be shown as Primary or Secondary values.

The connection and configuration process for the LQT60 transducer is following for informative purposes. Read always the respective product manual for actual specifications and different requirements.

3.1.1 Monitored parameters

These are the parameters that our transducers can measure.

P	Power $P=S*\cos(\varphi) [W]$	IS	System current with sign
Q	Reactive power $Q=S*\sin(\varphi) [var]$	PF	Power factor $PF=P/S$
S	Apparent power $S=rot(3)*Uh*Ih [VA]$	QF	Reactive power factor $QF=Q/S$
U	Voltage	LF	= sign(Q)*(1- PF)
I	Current	PA	Phase angle
		F	Frequency

3.2 Input settings

Name of measuring point	Free text – 20 characters
Primary	Primary: U: V, kV, MV I: A, kA
Secondary	Transformer ratio
System connection	-11 System connection: For more information see page 5.
Configuration using	<p>Configuration using: choose which values will be shown.</p> <ul style="list-style-type: none"> • Primary values – values based on primary data. • Secondary values – values based on secondary values.
Read configuration	Read configuration: Read present settings from the transducer to ConfigLQT.
Apply configuration	Apply configuration: Save the data to the transducer.

3.2.1 System connection

Select the appropriate diagram for the used network.

The analogue outputs can be freely configured to the desired measured quantity within the allowed measuring range. Select the quantity you want to measure using the drop-down list. In the **Input Secondary** field, the start values are to be written in the first space, any breakpoints afterwards and the end value at last. Under **Output Value** the corresponding values of the output signal shall be indicated.

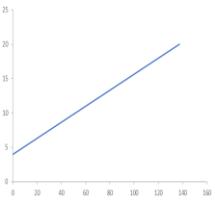

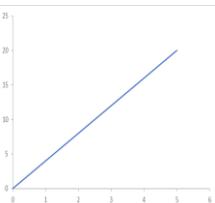

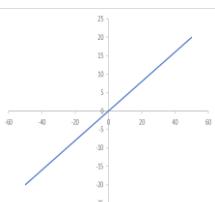

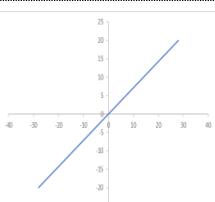

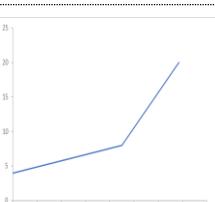

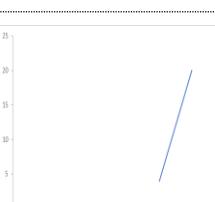

Click *Apply configuration* to transfer and save the new settings in the transducer.

To simulate the outputs for testing purposes, choose **Fixed Output**, fill in the desired value and click *Apply configuration*.

3.3.1 Measured quantities

Prefix	Quantity	Calculation	System / Phase
I	Input current	$(I_1+I_2+I_3)/3$	System
I1	Phase current L1		L1
I2	Phase current L2		L2
I3	Phase current L3		L3
U	Input voltage	$(U_1+U_2+U_3)/3$	System
U1	L1 Phase voltage		L1

F	Frequency		System
Fixed Output	Fixed output		

3.3.2 Example of settings for the analogue outputs

	Measuring main voltage L1-L2 IN: 0 – 137,5 V OUT: 4 – 20 mA	Secondary 0 137,5	Output 4 20	
U12				
	Measuring current I1 IN: 0 – 5 A OUT: 0 – 20 mA	Secondary 0 5	Output 0 20	
I1				
	Measuring total power IN: ±50 MW OUT: ±20 mA	Primary -50 50	Output -20 20	
P				
	Measuring total power IN: ±28 MVar OUT: ±20 mA	Primary -28 28	Output -20 20	
Q				
	Measuring main voltage L1-L2 with voltup. IN: 0-90-137,5 V OUT: 4-8-20 mA	Secondary 0 90 137,5	Output 4 8 20	
U12				
	Measuring frequency 45 – 55 Hz IN: 45 – 55 Hz OUT: 4 – 20 mA	Secondary 45 55	Output 4 20	
F				

3.4 Other outputs

3.4.1 Energy pulses

Under the **Binary outputs** tab, you can change the settings for the output mode, type of energy and direction of measurement. You just need to fill in the pulse frequency and all other quantities are calculated automatically.

Measured values				Analog outputs				Binary outputs				Serial communication port			
Binary output 1 Output mode: Pulse mode Energy of P or Q: Active energy P Direction: Exported Pulse frequency: 500 imp/kWh Secondary Pulse frequency: 476.3 imp/h Pulse value: 0.025 imp/kWh Primary Pulse value: 40 kWh/imp Primary Pulse length: 50 ms				Binary output 2 Output mode: Pulse mode Energy of P or Q: Active energy P Direction: Imported Pulse frequency: 500 imp/kWh Secondary Pulse frequency: 476.3 imp/h Pulse value: 0.025 imp/kWh Primary Pulse value: 40 kWh/imp Primary Pulse length: 50 ms											
Hardware limits of Binary output 1 Max pulse frequency: 10000 imp/h Min pulse length: 50 ms Max voltage: 110 V Max current: 0.1 A Binary output type: Solid State Relay				Hardware limits of Binary output 2 Max pulse frequency: 10000 imp/h Min pulse length: 50 ms Max voltage: 110 V Max current: 0.1 A Binary output type: Solid State Relay											

3.4.2 Modbus

Choosing the **Serial communication port** tab you can change the modbus settings. There are different mapping profiles to choose from. You can also find all necessary information about RS-485 settings under the **Modbus** tab.

Measured values				Analog outputs				Binary outputs				Serial communication port

3.4.3 Profibus / Profinet

Here you can set the address for the anybus or choose **default**. The GSD file is available to download from our webpage: www.tillquist.com.

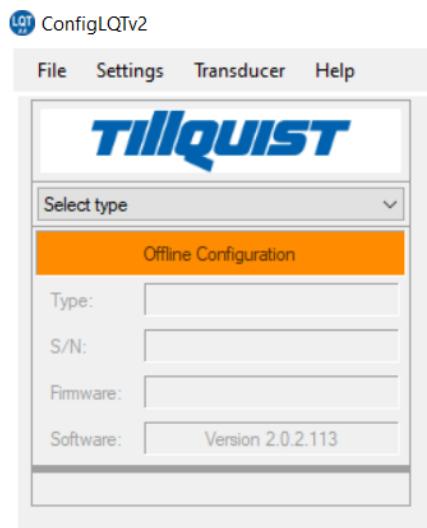

3.5 Offline configuration

Follow the next steps to make a configuration in offline mode.

1. Select *Transducer* menu -> Configuration Mode -> Offline Configuration.
2. Choose the desired type of transducer from the drop-down list.

You can now see the text 'Offline Configuration' with orange background at **Connection status** field.

3.6 Save / Open a saved configuration

The configured parameters of a transducer can be saved to a file which can easily be downloaded to other transducers.

3.6.1 Save a configuration to a file

1. Select *File* menu and click *Save as*.
2. Write a file name and choose a desired folder.
3. Click *Save*.

3.6.2 Open a configuration from a saved file

1. Select *File* menu and click *Open file*.
2. Choose the desired configuration file (XML-dokument).
3. Click *Open*.

4 Firmware upgrade

The firmware of our transducers can be upgraded with the ConfigLQT software. To do so, connect the transducer to the computer with a USB cable.

1. Start ConfigLQT.
2. Select *Firmware Upgrade* from *Transducer* menu.
3. Choose the file with the new firmware and click *Upgrade*.
4. When the upgrade is done, the auxiliary voltage must be disconnected so that the transducer restarts, allowing the new firmware to take effect.
5. Check that the right firmware version is displayed among the transducer's data.
